## LOGICAL ORDER – CLEAR GROUP STRUCTURE FOR PARAMETERS

Due to the growing complexity of modern refrigeration plants, the number of parameters is increasing continuously. How can such a „flood of data" still be managed and controlled efficiently? In the new control concept G4, all parameters are separated into 4 logical groups with corresponding operating menus (besides the basic welcome menu).

The new structure makes it a lot easier for you to orientate yourself when navigating through the application. Additionally, you can always see which functions are available in the current menu – your further navigation options will be indicated by respective symbols.

- Available navigation options in the display
- LED Warning
- Save key
- LED C-BUS/F-BUS
- Shortcut (2 sec)
- LED Display „Lock status"
- Cancel button
- Navigation keys
- Info key

## FRIGOLINK G4 – MAIN ADVANTAGES AT A GLANCE

- New front design facilitates easy and intuitive operation – with arrow keys and self-explanatory symbols, you can navigate fast and comfortably
- Convenient one-finger operation instead of pressing key combinations with 2 fingers
- More information by means of a versatile graphic display – apart from the values being searched for, you will also see your operation options in the menu currently selected
- Find the value at high speed - parameters can be accessed easily through so-called „Quicklinks". Unique numbers for each parameter prevent wrong results and improve communication between service partners
- Systematic structure of parameters – the well-structured division into 4 main menus helps you to orientate yourself in the system
- Complex operating steps can be supported by so-called „assistants" – besides, you will benefit from context-sensitive help
- Copy-and-paste function accelerates the configuration of cooling positions – you just need to copy the parameters of a cooling positions that is already installed
- Better orientation thanks to feedback function – on the display you can see which action you last executed
- Multimedia Crossover via QR code – a QR code in the display enables you to call up comprehensive information on your smartphone with our Wurm App „Paperless info"

## FASTEST WAY TO REQUIRED VALUES

# QUICK, DIRECT AND CONVENIENT – THE NEW CONTROL CONCEPT G4 PROVIDES INCREASED USER COMFORT

New concept and new design – Wurm has completely redesigned its control concept for Frigolink. The successful product line in Wurm's portfolio introduces the master modules HKS and HVx with the new concept G4. User-friendliness and operating comfort are of paramount importance for the new concept.

As the hardware is identical with G3, the new main module can be exchanged without any problems. At the same time, significant changes are already indicated by the front view of the device with its operating elements.

Arrow keys make it possible to navigate comfortably upward and downward, to the left and to the right in the current menu. One-finger operation replaces the less suitable 2-finger operation as often used with key combinations. Thus, you will get the required information without the „detour" via key combinations.

3 additional keys on the user interface are indicated by clear symbols for the „Cancel", „Info" and „Save" functions. As soon as you save your data entries, the respective settings will be shown in the display - this „feedback" function enables you to view and monitor your latest data entries.

# ONE KEY FOR VARIOUS HELP FUNCTIONS

According to your current position in the navigation, you just need to press the info icon „i" and a context-sensitive help will be shown in the graphic display.
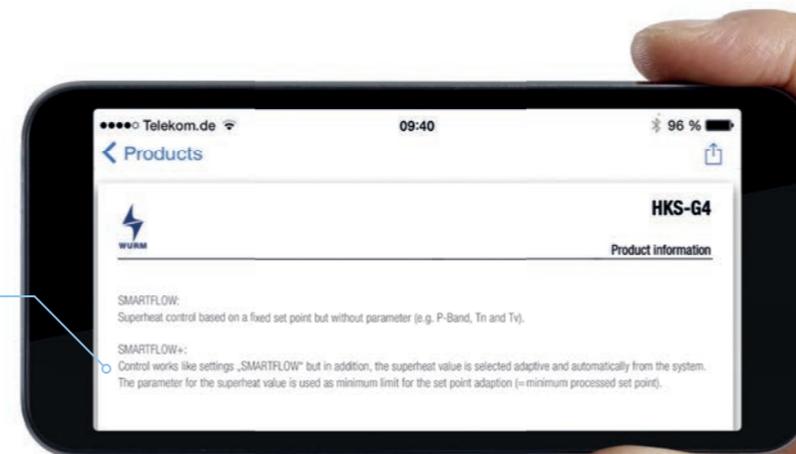

In case you need more detailed information, you can call up the appropriate QR code by pressing the icon „i". With the Paperless App by Wurm on your smartphone, you can read out the QR code and the required information will be shown immediately on the smartphone display.

For complex operating steps, you can call up one of 4 assistants (one for each main menu) using shortcut keys. The assistants (wizards) will guide you smoothly through the operation.

# THE QUICK WAY TO FIND THE VALUES YOU ARE SEARCHING FOR – QUICKLINKS

A great advantage is the introduction of Quicklinks in the new control concept. They allow easy and quick access to specific parameters. Quicklinks consist of unique multi digit numbers, each of them referring to one specific value or parameter.

You just need to enter the number to get to the corresponding parameter immediately and without any „detour". Thus, you will save both a sequence of various commands and the time to enter these commands.

Their practical use can be illustrated easily with an example: In the event of a support request via telephone hotline, misunderstandings with regard to the respective value or parameter cannot be excluded. By using a Quicklink number instead of the value's name, misunderstandings can be avoided. Communication between hotline and foreign-language users in particular becomes much easier.

# PRACTICAL COPY-&-PASTE FUNCTION

Another key feature is a practical copy-and-paste function. The configuration of a new cooling position is easier than ever before. You just need to copy values and parameters of an existing cooling position and paste them into the input mask for the new one. There is no faster way to configure a new cooling position!

With G4, Wurm has developed a control concept that provides significantly increased clarity and leads you directly and without detour to the desired information.

A concept with great potential that will be adapted to other Wurm solutions in future.
